Ontario-grown hops coming to a brew near you

Trent Hills - By now fresh craft beer made from Ontario hops harvested this year could be hitting the shelves of your favorite local watering hole.

If you're in the Ottawa area, some will be made from hops harvested on a warm September day, at a yard here just east of Campbellford, not far from the banks of the Trent River.

Here at Lot 17 on this first decent day of September two brewers, two hops growers and assorted family members have gathered. The day's job? The harvesting of 460 plus bines grown and tended lovingly by Fred and Loraine Thomson, their son Adam and his wife Stephanie.

Lot 17 is small as hops yards go; but the work keeps retired Agricore rep Fred Thomson thinking, experimenting and innovating. Since 2011 he and son Adam have been growing and expanding this yard, experimenting with everything from varieties to soil treatment, bine management to pest control.

"There's a certain amount of 'art,' to growing hops," Thomson says.

"One of my key learnings this year is how to pick the right time to prune them, and how to prune them," he says explaining that the bine should reach the 16' top of the coir by the summer equinox.

"Ours didn't do that and that was my fault," he says, admitting to being a little over aggressive with the knife.

"They didn't like that."

"Hops, because it's a re-emerging crop, there are a lot of things to relearn," he says, explaining that under ideal conditions they can grow 6" to 1' a day.

Hops, Thomson says, are resilient; they over-winter well. But they are susceptible to all manner of disease and insect which can ruin the fragile hop cones, and as that cone is developing, "they are heavy drinkers."

Most recently though the Thomsons's journey to learn more about the business of hops saw them invite Rob Brennan in for the harvest.

Brennan, of Old 4th Hop Yard at Williamstown, has recently imported the province's first hops harvester hops harvester; new technology which takes most of the manual labour, out of this job.

HopsHarvester.com's hop harvester works very much like a stationary combine. Bines laden (hopefully) with mature hops are fed on a conveyor into the back of the machine, through a patent-pending rotator bar. The heavier wet hops fall onto a conveyor belt and are filtered out the side to a con-

tainer while the lighter-weight stripped vines and leaves are segregated on an upper conveyor and belted out the front where they are gathered for later destruction.

"If you're going to grow at all," says Brennan, "eventually you're going to have to mechanize."

Because as hops growers the province over have learned, one hops harvesting party is enough.

"Nobody has that many friends," says Brennan.

Hops growing is an emerging industry here in Ontario. Approximately 35 growers are ramping up production

with Ontario's hop acreage now at about 60 acres. The province still imports about 550 kg annually. That's \$7 million of product which

could be grown in Ontario,

says OMAFRA's latest report on the crop.

Still, the province's acreage has gone up by 300 per cent since 2009, with the Thomsons hoping to quadruple the size of their yard in the next four years, depending on Adam's military postings.

"It's plenty for me to handle in the day to day by myself."

Terroir, Thomson, says is important as Lot 17 has worked with Dominion City Brewery in developing a special craft brew.

"If you can put up the quality, if you can put up the product...in a format the brewer can use, there is no end of demand for this product. We aren't even scratching the surface," he says.

"In my 40 plus years of being involved in agriculture I don't think I've ever seen a crop that has the potential this one has."

Is it lucrative?

"I think so. Smart producers will establish relationships with

Blue Means Performance

The LEMKEN Fall Demo Tour is on now! Call your local dealer to add your farm to the tour today, and see how a RUBIN 9 performs in your fields.

The RUBIN 9 compact-disc gives optimal soil-trash mixing and full-surface cultivation in all stubble conditions. Clean up your fields by incorporating stalks and leveling ruts in one high speed pass.

LEMKEN
The Agrovision Company

(800) 488-0115
www.LEMKEN.ca

The RUBIN 9 is the only compact-disc with:

- Individual 24 inch notched blades
- Two rows of rebound harrows
- Preset spring protection for individual discs
- 19 models ranging from 8 to 40 feet

Ask your dealer for a demonstration today!
